Bitcoin capital needs everyday uses.

Mezo lets Bitcoin holders borrow mUSD. Everyday payments still need a clear recipient, a familiar checkout and a reason to acquire that money.

Access

Social sign-in and an embedded wallet make the first payment easier.

Use

A merchant invoice gives mUSD a destination beyond transfers among existing holders.

Confidence

Exact amounts, verified receipts and clear recovery help users trust the outcome.

Pocket. Send. Request. Get paid.

One mobile app for mUSD payments and Mezo money management. Users keep funds in their own Privy embedded wallets.

Home

Send to a username or wallet, create an invoice and follow Activity.

Swap

Exchange mUSD with BTC, mUSDC or mUSDT through verified Mezo testnet pools.

Wealth

Manage Savings, MEZO locks and liquidity pools. Borrow against BTC from Home.

A payment link that settles in mUSD.

A business creates an invoice, shares its link or QR and receives mUSD directly. Checkout keeps the invoice open through sign-in.

Create

Business profile, exact mUSD price, description and expiry. Each invoice preserves its merchant-name snapshot.

Pay

The customer checks the recipient and amount, then signs one direct wallet transfer.

Confirm

Pocket verifies the transaction and records the paid invoice and Activity together. Recovery uses the existing hash.

Wallet to wallet, verified on Mezo.

The user wallet holds and signs the funds. Postgres records profiles, invoices and payment outcomes; it does not create spendable money.

User wallet

Privy sign-in resolves the embedded wallet. Direct payments do not use PocketVault.

Mezo

mUSD moves on-chain. The payer uses BTC for gas; the recipient needs no transaction.

Pocket API

Verify sender, token, exact recipient/amount, calldata, receipt and Transfer log. Prevent invoice-proof reuse.

Deep Mezo integration, from one wallet.

BTC-backed Troves and sMUSD Savings remain central. Wave 2 fixes Savings interest that the stored mapping alone could incorrectly show as zero.

Borrow

Open, inspect, partially repay or close the owning wallet's Trove. Read protocol debt limits, fees and health.

Savings

Deposit, withdraw and claim. Total claimable interest includes global-index accrual, with a positive payout simulation.

Verified claims

Two successful claimYield receipts: 187.366117347141378 and 0.00228183663115 testnet mUSD.

Manage Mezo assets inside Pocket.

Reviews show amounts, fees, slippage, minimum output and deadlines. Each approval and final action gets a separate user confirmation.

Swaps and pools

mUSD/BTC, mUSD/mUSDC and mUSD/mUSDT. Add/remove liquidity and claim pool fees; empty pairs cannot swap.

MEZO locks

Create, top up, extend or withdraw eligible locks. Permanent Start unlock starts a new 208-week wait.

Recovery

Save pending actions by wallet and chain. Check the existing receipt after reload without signing again.

A live liquidity addition is confirmed. Fork and wallet fixtures cover broader lifecycle behavior.

Receipts, checks and an honest baseline.

Specific on-chain actions are verified. Local validation covers payment integrity, merchant profiles, Savings accounting and Wealth recovery.

On-chain

Two successful Savings claims and one liquidity addition. The inspected Trove is closed; no repayMUSD receipt.

Validation

177 passing assertions: 61 Wealth/profile/reward, 59 checkout, 39 payment and 18 reconciliation.

Current usage

6 personal accounts, 4 faucet claims and 8 paid direct transfers. No merchants or invoices at the November 3 baseline.

Account counts do not prove independent people. All financial evidence is testnet.

Prove a reason to acquire and reuse mUSD.

The first proposed merchant is the product's @musd_pocket account. Independent customers must pay an intended item or service for demand evidence.

First pilot

One builder-operated business and two independent customers, each using their own account and wallet.

Measure

Settled invoices, distinct independent payers, fulfillment, confusing steps and returning users.

Welcome

20 testnet MEZO locked for two weekly epochs (7–14 days). The campaign is deployed and funded for five claims; first pilot receipt pending.

Merchant fees that can fund useful service.

Proposed disclosed fees on successful merchant payments, with part covering BTC gas sponsorship and operations. Validate pricing with real merchants.

Payments

Show a merchant fee before payment. Ordinary P2P sends are not the first fee target.

Unit economics

Measure actual gas and support costs before promising sponsorship or margin.

Merchant tools

Premium reporting and reconciliation can follow demonstrated demand.

Ship the build. Prove the use.

Builder: greyw0rks · github.com/greyw0rks/musd-pocket. Wave 1 feedback is the checklist for the next delivery.

Publish

Current merchant + Home/Swap/Wealth build, direct-transfer README and this pitch deck.

Prove

Independent merchant/customer transactions and feedback; one intended partial repayment with before/after debt.

Complete

Verify the first new-campaign reward receipt. Confirm Wave 2 rules/deadline and retain submission confirmation.
