Bitcoin-backed money. Everyday use.

Borrow against BTC. Pay people and merchants in mUSD.
Manage Mezo assets from one wallet.

Mezo Testnet **Live app + Android** **Track 2**

App interface · illustrative account and balances

A balance is only the beginning.

Mezo gives Bitcoin holders access to mUSD. Pocket connects that money to a recipient, a checkout and a reason to return.

01 **Access mUSD** → 02 **Pay a merchant** → 03 **Return and reuse**

01

Make access familiar

X or email sign-in creates an embedded wallet. The user holds and signs their funds.

02

Give mUSD a destination

Merchant invoices and payment-gated offers turn an available balance into a concrete payment journey.

03

Make the outcome clear

Review the recipient and amount. Confirm the transfer. Recover uncertainty using its saved hash.

One wallet. Three places to use it.

The Android app brings payments and Mezo money management into a mobile interface.

01

Home

Send to a username or wallet. Request payment. Pay an invoice. Borrow against BTC.

02

Swap

Exchange mUSD with BTC, mUSDC or mUSDT through verified testnet pools.

03

Wealth

Save mUSD, manage BTC locks, add or remove liquidity, and claim pool fees.

Floating navigation **Browser OAuth returns to app** **Google-linked receipt preferences**

Private receipt preferences persist. Automatic receipt email delivery is not configured.

Give mUSD a reason to move.

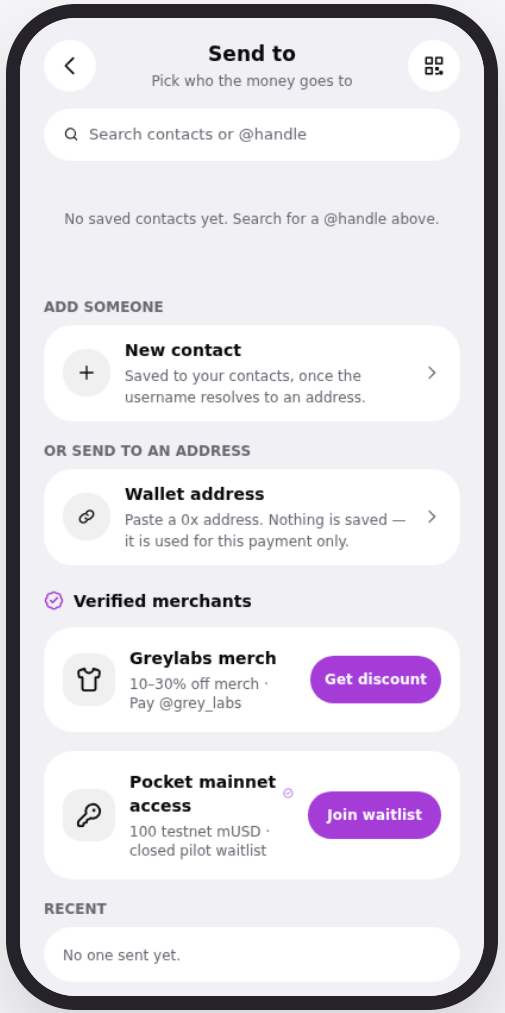

Business profiles, invoice links and QR checkout let merchants receive directly into their own wallets.

Greylabs merch

Any confirmed positive mUSD payment to @grey_labs unlocks one persistent random 10–30% discount. Coupon issuance and validation enforce eligibility.

Pocket mainnet access

Send → Verified merchants contains the 100-testnet-mUSD closed-pilot waitlist. Each wallet recovers its own invoice; payment does not activate mainnet access.

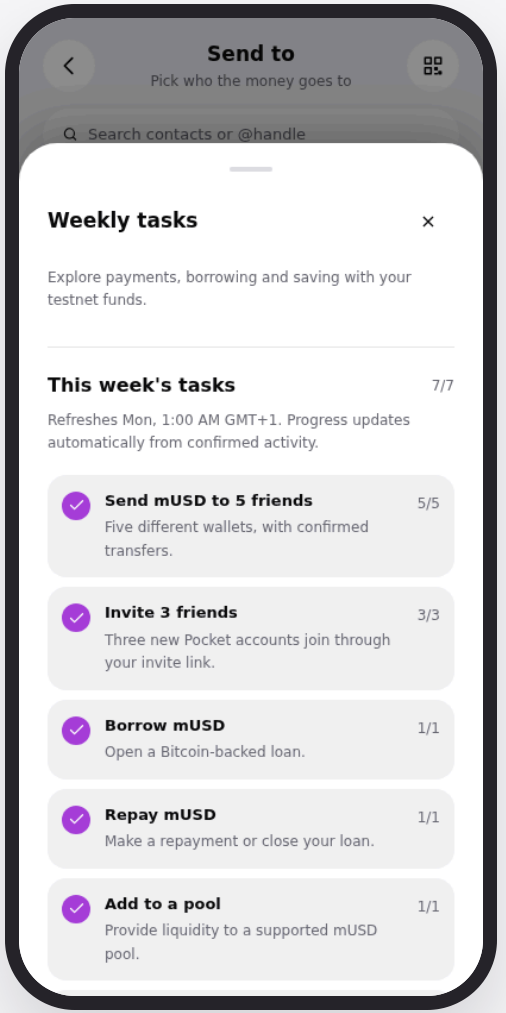

Merchant interface · fixture session

A checklist built around real activity.

Weekly tasks give users a clear next action from their first visit. Completion comes from confirmed activity and qualifying referrals.

- ✓ Send mUSD to 5 different friends
- ✓ Invite 3 new friends
- ✓ Borrow mUSD
- ✓ Repay a loan
- ✓ Add liquidity
- ✓ Swap mUSD
- ✓ Lock BTC

Tasks reset weekly. The checklist does not promise a separate weekly token payout.

Weekly tasks · fixture completion states

Starting funds come from the existing testnet faucet. The welcome reward has ended.

Borrow. Repay. Recover your collateral.

A verified testnet journey through Mezo Troves, with debt changes checked after interest accrual.

01
0.05 BTC locked
→
02
2,000 mUSD minted
→
03
10 mUSD repaid
→
04
0.05 BTC returned

Savings principal

sMUSD represents 1:1 mUSD principal. Interest accrues separately from the shares.

Interest paid, not inferred

Two verified payouts: 187.366117347141378 and 0.00228183663115 mUSD. Fresh and recovered claims check the actual token payout.

Specific builder-wallet outcomes on Mezo Testnet. Protocol fees and reserves are included in debt.

Manage the rest of your Mezo wallet.

Supported holdings stay visible. Reviews show amounts, fees, minimum output, slippage and deadlines before signing.

01

Swaps + liquidity

Verified mUSD pools, liquidity addition/removal and fee claims. One live liquidity addition has receipt evidence.

02

BTC locks

Create, top up, extend and withdraw veBTC positions. Testnet maximum: 30 days, rounded weekly. Previous MEZO positions remain manageable.

03

Recover each action

Pending actions are scoped by wallet and chain. Reopen and check the saved transaction instead of signing again.

Broader lifecycle coverage uses fork and wallet fixtures; it is separate from live receipt evidence.

The wallet signs. Pocket verifies.

Direct payments move on Mezo. Pocket records verified outcomes and keeps uncertain transactions recoverable.

2 Verified Savings payouts

Payment integrity

Check network, sender, token, recipient, exact amount, calldata, receipt and Transfer event. Block invoice-proof reuse.

Account consistency

Reads and signing follow the session wallet on Mezo. Claims save a hash or nonce after an uncertain wallet response and recover the actual payout.

Android 0.2.5 validation covers build, lint, certificate, alignment and APK assets. Physical device/account flows remain unverified.

Start with merchant value.

Track 2: Access and Distribution for MUSD/MEZO. The model begins with useful payment destinations and reliable checkout.

01

Proposed merchant fees

Disclosed fees on successful merchant payments could cover operations and future BTC gas sponsorship.

02

Validate the economics

Measure settlement, gas and support costs with merchants before committing to pricing or sponsorship.

03

Expand after demand

Merchant reporting and reconciliation can follow evidence of repeat use. Ordinary P2P sends are not the initial fee target.

Today, the payer supplies BTC gas. Pocket fee collection, revenue and universal gas sponsorship are not implemented.

Merchant checkout and discount offers are live product mechanisms; independent customer demand is still a pilot question.

Pilot. Measure. Prepare for Mainnet.

Three planned milestones after the buildathon, starting with independent merchant customers and repeat use.

01

Nov 16–30, 2026

Pilot one merchant and two independent customers. Capture fulfillment, feedback, repeat use and Android account acceptance.

02

Dec 1–15, 2026

Improve merchant reporting and reconciliation. Measure gas, operations and support costs to validate a disclosed fee.

03

Dec 16, 2026–Jan 15, 2027

Prepare a limited Mezo Mainnet pilot. Use verified recovery, protocol integrations and merchant feedback to set launch scope.
