Bitcoin capital needs everyday uses.

Mezo lets Bitcoin holders borrow MUSD. New users still need a simple way to turn that money into a payment, a request or productive savings.

Access

Wallet setup and unfamiliar transaction steps make the first payment harder than it should be.

Use

Borrowed MUSD needs useful destinations: other people, merchants and Savings.

Confidence

Users need a clear recipient, amount and confirmation before trusting a money app.

Pocket. Send. Request. Get paid.

A mobile web app with social sign-in and a Privy embedded wallet. Users keep MUSD in their own wallet and send directly to a username or address.

Sign in

X, Telegram or email. An embedded wallet is created and synced to a Pocket profile.

Pay and request

Resolve a recipient, review the amount and sign a direct MUSD transfer.

Borrow and save

Access Mezo Troves and the sMUSD Savings vault from the same wallet.

One wallet. Four useful actions.

Pocket combines direct payments, merchant invoices, Mezo Borrow and Savings. The wallet signs each payment; the server independently verifies its receipt.

01 · Send / Request

Direct transfers and payment-request records support everyday payments.

02 · Borrow

Open, inspect, repay or close a BTC-backed Trove using protocol-specific calls.

03 · Save

Deposit MUSD, withdraw and claim Savings yield from the embedded wallet.

Wallet to wallet, verified on Mezo.

Pocket's payment path is direct. Postgres stores profiles, requests and activity; an internal ledger does not authorize or fund the current transfer flow.

User wallet

The Privy embedded wallet holds the MUSD and signs the ERC-20 transfer.

Mezo

Mezo executes the transfer. Native BTC pays gas; receiving requires no recipient transaction.

Pocket API

The server verifies transaction identity and outcome before recording payment activity.

Legacy vault settlement is isolated from direct payments.

Borrow, save and welcome new users.

Wave 1 feedback recognized the Trove and sMUSD integrations as deep and protocol-correct. The remediation corrects the Savings false-zero read and adds a welcome claim.

Troves

BTC collateral, MUSD borrowing, position health and user-authorized repay/close actions.

sMUSD Savings

Deposits, withdrawals and yield claims. Claimable interest includes global-index accrual.

200 MEZO welcome

One testnet claim, locked for two weekly epochs as a user-owned veMEZO NFT. Campaign deployed and funded with 200 MEZO, enough for one claim.

Repay and claimYield live execution receipts still need collection.

A merchant checkout gives MUSD a destination.

A merchant creates an invoice, shares a payment link or QR, and receives a direct MUSD transfer with verified confirmation. Checkout is implemented; independent merchant pilots remain to be established.

A reason to acquire MUSD

Customers need MUSD to pay a merchant, extending the product beyond transfers among existing holders.

A reason to keep using it

Merchants receive funds directly and can reuse the wallet for payments or Savings.

Measure actual use

Track independent paying wallets, settled invoices, repeat customers and merchant feedback.

Welcome rewards support onboarding; their claims alone do not prove new MUSD demand.

Merchant fees that can cover sponsored gas.

Proposed monetization starts with a disclosed merchant-payment fee. Set pricing after pilot feedback and measured gas costs; no fee rate, revenue or profitability is claimed yet.

Merchant payments

A small fee on successful merchant transactions, shown before payment.

Gas sponsorship

Allocate part of the fee to BTC gas and operating costs. Validate the margin using real transactions.

Future services

Premium merchant tools can follow demonstrated demand. Ordinary P2P sends are not the initial fee target.

Strong integration. Next: proof of use.

Builder: greyw0rks · github.com/greyw0rks/musd-pocket. Merchant checkout and the funded welcome campaign are live. Successful user transactions and independent adoption remain to be demonstrated.

Technical evidence

Welcome deployment and funding receipts are recorded; a real-token/escrow claim simulation succeeds. Regression and contract checks pass. User welcome, repay and claimYield receipts remain pending.

Adoption targets

Recruit 10–20 external users and 2–3 merchant pilots. Aim for 20+ transfers and 5+ requests. These are planning targets, not achieved metrics.

Next milestones

Collect missing embedded-wallet receipts; recruit genuine merchant pilots and external users; record feedback and returning usage. Additional welcome claims need more MEZO inventory.
